presence of I. After the precipitate has settled, it is transferred into a filtering crucible using a little amount of cold water and washed first with acetone and then with ether, dried from 5 to 10 min. in an exsiccator and weighed. For the microdetermination of Cu, the solution to be analysed and containing not more than 4 mg of Cu is diluted with water to 5 or 8 ml, 0.01 g of $\text{CH}_3\text{COONH}_4$ is added and the analysis is continued as described above. The relative error of the macro- and microdetermination is equal to, or less than, 0.8%.

Title : A New Sensitive Method for the Detection of Cobalt.

Orig Pub : Rev Chin, 9, No 4, 218-219 (1958) (in Rumanian with summaries in German, French, English, and Russian)

Abstract : The authors have developed a new method for the detection of Co(II) using β -furoinoxime (I); this reagent appears to be more sensitive than α -furoinoxime (RZhKhim, 1958, 46376). The best results were obtained with a dropping analytical procedure on filter paper, provided the prescribed order of operations is observed. One drop of the solution to be analysed is placed on a piece of filter paper, the solution is dried, and one drop of I solution is added after which the paper is placed over NH_3 vapors. When Co(II) is present, a brown spot will appear.

Card 1/2

Abs Jour : Ref Zhur - Khimiya, No 2, 1959, 4328

The detectable minimum of Co is 0.16×10^{-5} ; the limiting dilution is 10^{-5} . The determination of Co is interfered with by the presence of a ten-fold excess of Bi(III) a 20-fold excess of Cr(III) and Al(III), a 100-fold excess of AsO_3^{3-} , Sb(III), Sn(II), and a 200-fold excess of Pb(II) and Hg(II). Under the conditions described Mn(II) gives a brown spot and Cd(II) and Zn(II) give a yellow spot. --

 Abstract : Tomato, cucumber, pepper and early cabbage sprouts
 were raised in nutrient pots with different com-
 positions at three farms in the Rumanian People's
 Republic in 1954. In all cases the yield was hi-
 gher and the vegetables ripened 10-15 days ear-
 lier. Pots made up of peat proved best. The
 addition of sawdust had a negative effect on the
 growth of pepper, tomato and cabbage plants.

Title : The Influence of the Preparation (Miltown) which Blocks
Thalamus Functions Upon the Secretion of ACTH

Orig Pub : Fiziol. norm. si patol., 1957, 4, No 6, 500-504

Abstract : The administration of Miltown (M) to rats blocks the effect of insulin, leading to the decrease of the number of eosinophils in the blood, but does not change the analogic effect of ACTH. When introduced separately, M does not affect the amount of eosinophils. Hypoglycemia due to insulin is not inhibited by M. According to the authors, the introduction of M changes the secretion of ACTH, which indicates that this secretion is regulated by thalamus.

Title : New Glass Silvering Method.

Orig Pub : Ind. usocara, 1957, 4, No 5, 218-222

Abstract : Description of a new procedure for silbering glass spheres,
toys and thermos containers, using a new reducing agent --
hydrazine hydrate. Silvering is effected in the cold,
which simplifies considerably the operation procedure.
Duration of the process is brief. The necessity of adding
NaOH, NH_3 and other agents to the solution, is eliminated.

"Microbiological Dosage of Antibiotic Mixtures."

Bucharest, Microbiologia, Parazitologia, Epidemiologia, Vol 11, No 3, May-Jun 66, pp 227-230.

Abstract [Authors' English summary modified]: The authors discuss the four principal methods for determining the components of antibiotic mixtures by microbiological means and emphasize the effectiveness of their use, either singly or in combination. The methods involve: use of microorganisms having a natural or acquired resistance to the individual antibiotics; inactivation by enzymes or chemical means of some of the components, followed by standard analysis of the remaining component; selective extraction; where one component is present in very small quantities, sufficient dilution to eliminate its action.

TITLE: Optimum granulation of quartz sand used for layer injections and filters in the case of Sarmatian formations

SOURCE: Petrol si gaze, v. 16, no. 9, 1965, 464-471

TOPIC TAGS: quartz, mineralogy

ABSTRACT: Laboratory determinations of the optimum granulation of quartz sand for layer injections and filters were confirmed by practical results in the wells. The determinations took into account the physical and mineralogical properties of the Sarmatian formations as well as the characteristics of the fluids. Optimal filter thickness and slit dimensions were also determined. Orig. art. has: 6 figures and 3 tables. [JPRS]

AUTHOR: Ianculescu, P.

TITLE: Substitution of steel casts and forgings by cast iron containing spheroidal graphite

PERIODICAL: Referativnyy zhurnal. Metallurgiya, no. 1, 1962, 27, abstract 11183 (Techn. nouă, 8, no. 15, 1961, 3, Rumanian)

TEXT: As a result of a systematic study and experimental works carried out at the engineering plant in Galați (Rumania), they succeeded to obtain in cast iron products such metal structure which had a high σ_p (up to 45 kg/mm²) and high δ (>8%). First of all the C and Si content, when processing molten and superheated cast iron, was increased to 6%. This measure alone raised the admissible σ_p to 50 kg/mm² and increased δ to 8%. In order to increase the Mg content to 0.8% in foundry cast iron having temperature reaching 1,000 - 1,300°C (when the Mg content in cast iron, due to the intensive evaporation of Mg, introduced before in the form of magnelite, makes up hardly 0.1%), it was decided at the Galați plant to add to the furnace cast iron Mg in the form of an alloy with Fe-Si. As a result of introduced improvements of cast iron composition, the

technology of two cast iron grades was worked out, namely 45-5 and 40-10 (after 6071-59 standard). 45-5 grade had $\sigma_b = 45 \text{ kg/mm}$ and $\delta = 24\%$. 40-10 grade had the same mechanical properties as CT OT 40A (St OT40A) (after Rumanian standard). The Galati plant turned out about 700 ton of modified cast iron in the form of products previously made of steel and bronze: forgings, covers for bushes, bush boxes, bands for brake shoes, fittings for locomotive boilers, using for the manufacturing of these parts a special cooler, which secured a uniform cooling of all surfaces and of the whole volume of the product. The products were heat treated by means of a hermetic bell in the atmosphere preventing metal oxidation, and the casting of taps was carried out in molds made of a low-melting metal. ✓

"Current Aspects of Epidemiology in Viral Hepatitis"

Bucharest, Revista Sanitara Militara, Vol 16, Special No., 1965; pp 308-319

Abstract: Comprehensive data about the epidemiology of hepatitis in Rumania and in Rumanian Armed Forces in particular revealed a number of paradoxical events and trends regarding the unexpected exacerbation in least likely units; seasonal and geographic changes are reported and discussed in the context of world-wide literature data, but few, if any, reliable conclusions can be reached as yet, indicating the continued need for very careful monitoring of events.
